

Starforge

Pocketful · Stage 1 accepted

WeAreDevelopers × BAND
Solo team: progmax

Four coding seats

Codex / gpt-6.1-sol

Seat	Ownership
Clean Coordinator	Plans and routes complete handoffs
Clean Auditor	Freezes independent requirements and tests
Clean Builder	Writes product source and deployment files
Verifier	Checks clean clones and accepts exact commits

One task, independent ownership

One complete human task in a fresh BAND room.

The Auditor freezes tests before Builder authorization.

The Builder owns product code; Verifier runs acceptance.

Full task and spec travel with every handoff.

Three real rejections

Wrong JSON reset types and atomic replacement

Concurrent reset work delayed health responses

Logins timed out during unchanged-state imports

Agents reviewed and repaired each in new commits.

Stage 1 verification

147 / 147 published tests

198 independent subtests · 6,051 HTTP calls

85 requirements rows · 12 inspection obligations

Offline containers · 2 CPU · 2 GiB · alternate ports

Delivered service and scope

Wallet balances, payments, requests and bill splits

Idempotent retries and atomic net settlements

Portable state recovery after source removal

Stage 1 is an HTTP API; no browser UI is shipped.

Actual API demonstration

€15.00 payment · one debit across an identical retry

Operation	Actual response
Initial balance	10,000 minor units (€100.00)
First payment	201 · new receipt · 1,500 minor units
Identical retry	200 · original receipt unchanged
Balance after retry	8,500 minor units (€85.00)

Stage 1 delivers an HTTP API. These are recorded service responses.

Actual BAND final outcome

The screenshot shows a chat interface for a room named "Starforge clean Stage 1". The header includes a search bar, filters for "Event type" and "Sender", and a count of 5 participants. The main message is from a "Clean Coordinator" dated October 5, 2026, at 18:42:12 PM UTC. The message content is as follows:

Clean Coordinator October 5, 2026 at 18:42:12 PM UTC
@Verifier CLEAN STAGE1 FINAL OUTCOME — ACCEPT.
Accepted exact product: a8805bf4dc2297e0953ea4a5979fcd85c98b95b4.
Frozen independent audit: 52b50da43a750452ed44fb9ab118c9576428a475.
Pinned organizer: 803560d2a678ace1414485c098eb0ab5380ffade.
Coordinator reread Verifier's final verdict/inspection reports, confirmed all85 ledger rows PASS and both source repositories clean at these exact revisions. No known required Stage1 gap remains.
Delivery: submission/stage-1 service source, Dockerfile and RUN.md. Full coordinator outcome: FINAL-OUTCOME.md. Reproducible safe acceptance evidence: checks/verify-20261005T221035Z/VERDICT.md, VERDICT.json, ledger-reconciliation.json, INSPECTION-RESULTS.md, SOURCE-INSPECTION.md; frozen ledger audit/LEDGER.md and suite commands audit/RUN.md. Actual commands/exits/full image/container/networkIDs/timing retained in attempt; raw credential/export artifacts remain private.
Fresh results: published147/147 with0errors/skips/deselection; frozen32methods/198subtests,6051HTTPcalls,max1.290244s. Both50reset loads100/100204,max6.635834/6.617504s. Both staggered probes all50validlogins200/all50imports204,maxlogin0.746269/0.749048s.400expanded import/auth/mixed calls,health regression,type/boundary/numeric regressions,gate/ABA/current-credential checks,12invalid-state recoveries,50mixedmoney-control jobs/11coherent snapshots and actual removed-source third-process portability all passed.2CPU/2GIB/offline/no-mount/default+alternatePORT observed,noOOM/restarts. Startup0.590353/0.559161s. Product image sha256:b23fd70d677488020ab3634d8090a425a973cdd4e1ac5ee2df70297b57571218.
Three genuine REJECT histories preserved unchanged in checks/verify-20261005T210331Z, checks/verify-20261005T211747Z and checks/verify-20261005T214608Z: reset types,reset/health deadlines,login/import-churn deadlines. Author repairs used new commits; audit/organizer/assertions never patched and counts never relabeled.
Timing: coordination began20:27UTC; final-attempt22:10:35-22:37:06UTC(26m31s-incl-reports); cleanup22:32:36UTC; coordinator-confirmation22:40UTC, ~2h13m total,well before04:30UTC stop. All attempt-owned containers/networks cleaned; prepared runner retained,parallel run untouched. ObservedCodex/gpt-6.1-sol/Coordinator/Auditor medium,Builder/Verifier high per verified briefing. Actual tokens/billing UNKNOWN,not zero.
Limits: acceptance only this exact pair; private judging suites unavailable. Expected Stage2 missingUI overshoot reported separately,Stage1 only. Optional private-task/participant/room-plan CLI operations were blocked; authorized local lossy checklist used,plan snapshot not published. No required product gap results from those bookkeeping limits. No publication/operator submission or synthesized room export. Owner's separate submission documentation/media/export workflow remains outside this completed source/test run.

At the bottom, there is a text input field with the placeholder "Tag an agent and describe the task..." and a small "@@" icon.

Full room export: 457 events · one human task · four coding seats

Reusable package and measured limits

Generic mandates + FACTORY + complete agent history

Three original rejections and frozen independent audit

About 2 h 13 m through final reconciliation

Billing unknown · private judging tests unavailable
